

Madoors System Professional Disinfection Tunnel

HOW DOES THE DISINFECTATION TUNNEL WORK?

- * Tunnel automatically detects incoming people with passive infrared radars and operates automatically.
- * Tunnel can be activated one way or two way. If it is activated in two directions, enter the tunnel from both directions and logout.
- * When entering the tunnel, a warning sound will be heard and the disinfection spraying system with UVA rays automatically starts to work, stops automatically after the dose is completed.
- * UVA rays are 311 nm and melt the oil layers of viruses and bacteria, while the degenerated spraying process completely destroys the damaged viruses and bacteria.
- * All kinds of viruses and threats brought by shoes are destroyed by the chemical in the shallow pool on the floor.
- * Thermal fever meter camera at the entrance of the Degeneration Tunnel, warning for people with high fever signal and if desired, it can control the entrance-exit units such as turnstiles and doors
- * Daily incoming and outgoing visitors are counted by the tunnel computer.
- * The device has its own medicine tank (150 lt). Each tank is about min. It is enough for 4000 passes. Mixed with water and degeneration without skin damage to the respiratory tract.
- * Since the device's degeneration nozzles are opened with a pressure of 30 bars, it turns the medicine into powder particles. It certainly does not wet the clothes and gives medication only in the form of moisture. The particles are at the micron level..
